

CRIMEGRAPH SOP

STANDARD OPERATING PROCEDURE

SYSTEM VERSION: v1.0.0 (Stable Release)

SYSTEM ARCHITECTURE: OFFLINE-FIRST, ZERO-CLOUD, DEVICE-LOCAL SQLite

COMPLIANCE: CPIA (Criminal Procedure and Investigations Act) Ready

1. SYSTEM ACCESS & BIOMETRICS

CrimeGraph is a highly restricted, encrypted environment. Security protocols must not be bypassed under any circumstances.

- **Authentication:** The application requires native device biometrics (Fingerprint / FaceID) to unlock. Ensure biometrics are properly configured in device settings.
- **Fallback Mechanism:** If biometrics fail or are unavailable, operators must input the device's secure master PIN.
- **Session Timeout:** The application will automatically drop back to the biometric lock screen immediately if left idle or pushed to the background OS level.

2. CASE MANAGEMENT & CPIA COMPLIANCE

All operational intelligence must be housed within a properly designated Case File to ensure strict disclosure compliance and maintaining the chain of custody.

- **Case Creation:** Tap **NEW OPERATION** from the Dashboard. You are required to provide a valid Reference Number (URN), Operation Title, and Classification Level (e.g., OFFICIAL, SECRET).
- **Archiving Cases:** Operations that are concluded or handed over to prosecution must be archived. Use the swipe/tap archive option on the dashboard. Archiving removes cases from active view without destroying the underlying records.
- **Audit Logging:** Every action taken within the system (node creation, relationship mapping, package export, deletion) is immutably recorded in the background Audit Ledger. **Do not attempt to modify the application data files externally.**

3. TACTICAL MAPPING (POLE MODEL)

The Graph Workspace serves as the primary analytical environment. It strictly enforces the standard law enforcement POLE data model (Person, Object, Location, Event).

- **Adding Nodes:** Tap the blue **+** button in the bottom right corner of the workspace. Select the appropriate entity type, assign a confidence rating (1-5 stars based on intelligence reliability), and input any known operational metadata.
- **Drawing Connections (Edges):**
 1. Tap the source node (e.g., a Suspect).
 2. Tap **Draw Connection** in the bottom inspector menu.
 3. Tap the target node (e.g., a Phone or Location).
 4. Define the relationship type (e.g., "OWNED_BY", "SEEN_AT").
- **Decluttering the Visual Graph:** During complex network analysis, use the red **FILTERS** button (top right) to temporarily hide specific entity types (e.g., isolate 'Persons' and 'Events' by hiding 'Digital Accounts').
- **Entity Deletion:** Tap any node or relationship line to open the inspector, then select **Delete/Sever**. This action is permanently reflected in the workspace and recorded in the audit log.

4. SECURE INTELLIGENCE SHARING

CrimeGraph utilizes military-grade AES-GCM cryptography to facilitate intelligence transfer between offline devices securely.

- **Exporting Intelligence:** Tap **EXPORT** in the workspace header. You must create a strong, one-time decryption password. The system will output an encrypted **.enc** intelligence package that can be transmitted over Signal, Bluetooth, or secure enterprise email.
- **Importing Intelligence:** Tap the **IMPORT** button on the main dashboard. Select an **.enc** file provided by a collaborating analyst and input the exact password they established. The package will instantly populate as a new Case File.

5. EMERGENCY PROTOCOLS: THE KILL SWITCH

In the event of physical device compromise, imminent operational exposure, or a direct directive to sanitize hardware, the Kill Switch must be engaged immediately.

- **Execution:** Navigate to the [Settings/Admin](#) tab. Scroll to the bottom and engage the red **WIPE ALL DATA** button.
- **Result:** This initiates a scorched-earth SQLite destruction protocol. All Cases, Intelligence Nodes, Relationships, and Audit Logs are permanently erased from device storage.
- **Warning:** This action is mathematically and forensically irreversible. Ensure data has been securely exported if preservation is required.
